

The Social Radio Executive Summary

1-liner: Social Radio is a versatile voice-activated hands-free platform to post and listen to content from all of your social networks.

What it does:

- “Catch up with your feeds via ‘Listening to Radio’” - hear curated content from your social networks, that you can customize. Algorithm learns what to filter out, the more lists you create.
- “Post exactly what you want to say!” - “Smart” Speech to Text with a voice-command-based precision input system to easily correct errors.

Potential:

The vast majority of smartphone users use their device to keep in-sync with their social networks. Just as how the compact touch-screen system created a universal new user-interaction motif, we believe that the equivalent universal system can be established with voice-control as the main form of input.

Distinction:

Content curation is mediated by an engine that adapts to what you filter out in the Social Network Content Playlists you create settings configuration modes.

The design features glance-able visual indicators, a non-robotic-sounding text-to-speech engine, as well as a patentable system for precision-modification of voice input.

Designed for versatility, either voice commands or UI buttons can be used.

By providing an **intuitive command interface** allowing for *precision input modification* in voice data, we believe this system will become a de facto standard for future forms of voice-to-text input.

Via AppRadio, the Social Radio system essentially turns your old car radio into the best way to share and consume your social media feeds.

A working app demo is available.
